Fund statistics definitions

Volatility is a statistical measurement that, when applied to an investment fund, expresses its volatility, or risk. It shows how widely a range of returns varied from the fund's average return over a particular period.

Alpha is a measure of a fund's over- or underperformance in comparison to the benchmark of the fund. Alpha represents the extra value the manager's activities have contributed, the greater the alpha, the greater the outperformance.

Beta is a statistical estimate of a fund's volatility in comparison to its benchmark. It depicts how sensitive the fund is to movements in the section of the market that comprises the benchmark.

Sharpe is the level of a fund's return over and above the return of a notional risk-free investment, such as cash or government bonds. The difference in returns is then divided by the fund's standard deviation (volatility). This is an indication of the amount of excess return generated per unit of risk. In general it is considered that the higher the Sharpe ratio, the better.

Information is a risk-adjusted measure of actively managed fund performance. It assesses the degree to which a manager uses skill and knowledge to enhance the fund returns. The higher the information ratio, the better. It is generally considered that a figure of 0.5 reflects a good performance, 0.75 very good, and 1 outstanding.

Top 10 holdings

Holding	Description	NAV
XPS Pensions Group	Actuarial consultancy	4.1%
Sabre Insurance	Insurance services provider	3.9%
Moneysupermarket	Price comparison website	3.7%
B&M	General merchandise discount retailer	3.5%
3i	International investor focused on private equity and infrastructure	3.4%
